Title: Dynamics after blowup: spontaneously stochastic solutions

Author: Alexei A. Mailybaev (IMPA, Rio de Janeiro)

Abstract: We present spontaneously stochastic solutions for inviscid non-local conservation laws, which appear immediately after the blowup. Starting with the Burgers equation and continuing with the Sabra shell model of turbulence (as well as its continuous 1D representation), I will show how the model can be mapped into a dynamical system in renormalized coordinates and time. The renormalized system has a solution in the form of a traveling wave, which describes a finite-time blowup. This wave is deterministic for the Burgers equation, while it becomes stochastic for the Sabra model. One of the limiting states of such stochastic wave corresponds to a deterministic solution at blowup time, while the other limiting state describes the developed turbulent state.
